Collaboration focused on five priority issues to:

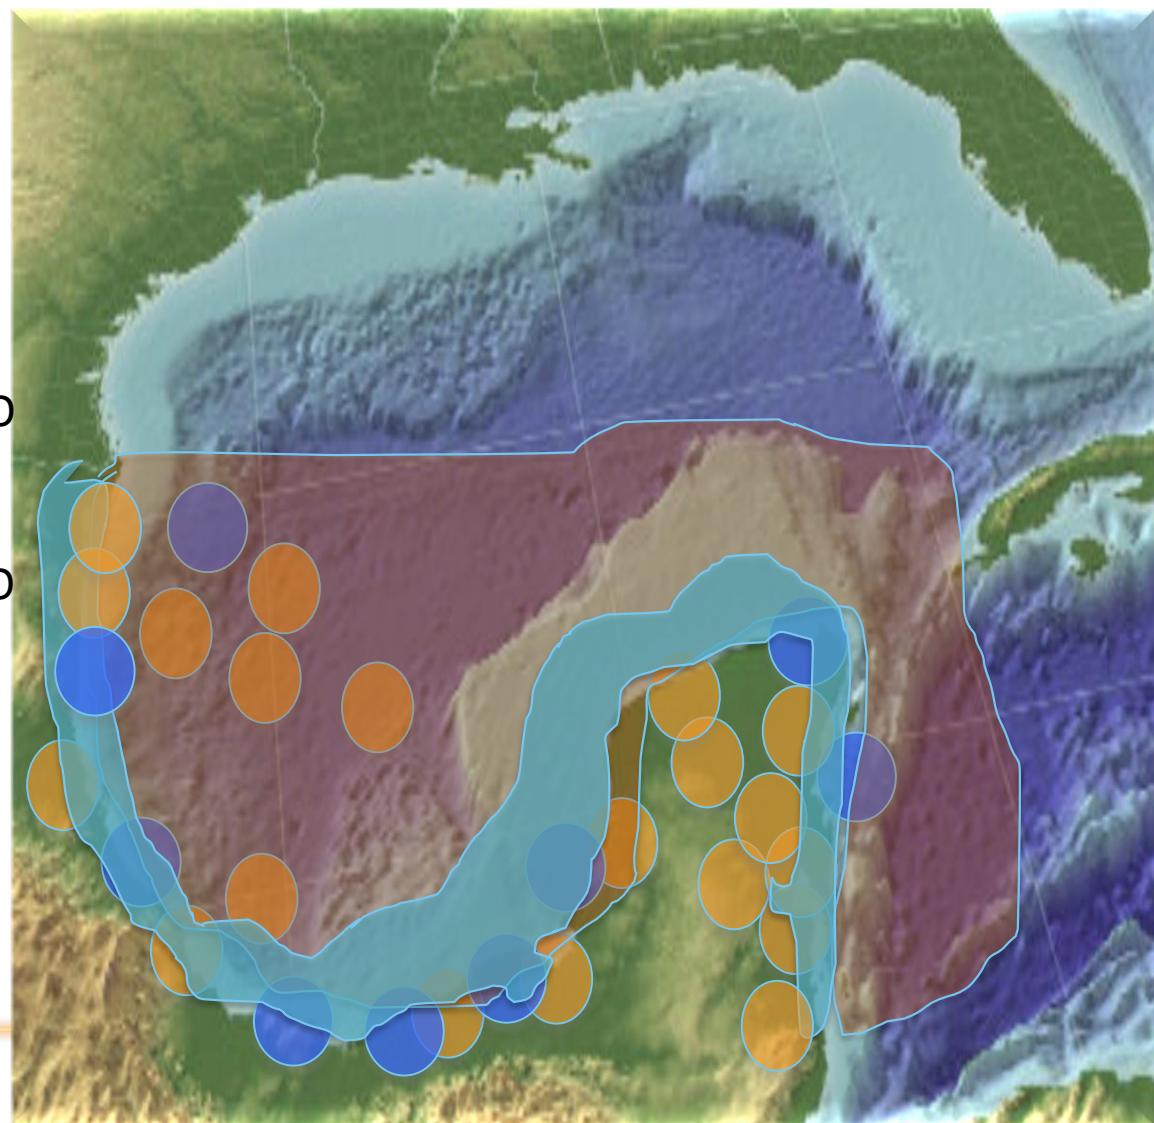

1. Conduct joint research MEX US Cuba in the Gulf
 - ✓ Base line development
 - ✓ Physical oceanography and biodiversity
2. Restore Coastal and Marine Ecosystems
 - ✓ Mangrove restoration
 - ✓ Blue carbon assessment in wetlands
3. Monitor Marine Ecosystems
 - ✓ Gulf deep waters, coastal and ocean observing system development
 - ✓ High frequency radars, glider technology development and oceanic buoys
4. Assess and reduce pollution
 - ✓ Oil, gas, hypoxia, harmful algal blooms
5. Propose climate change adaptation models
 - ✓ Local models for sea level rise & flooding
 - ✓ Models and assessment of coastal erosion
 - ✓ Enhance coastal communities resilience

TOPIC

1) Physical:

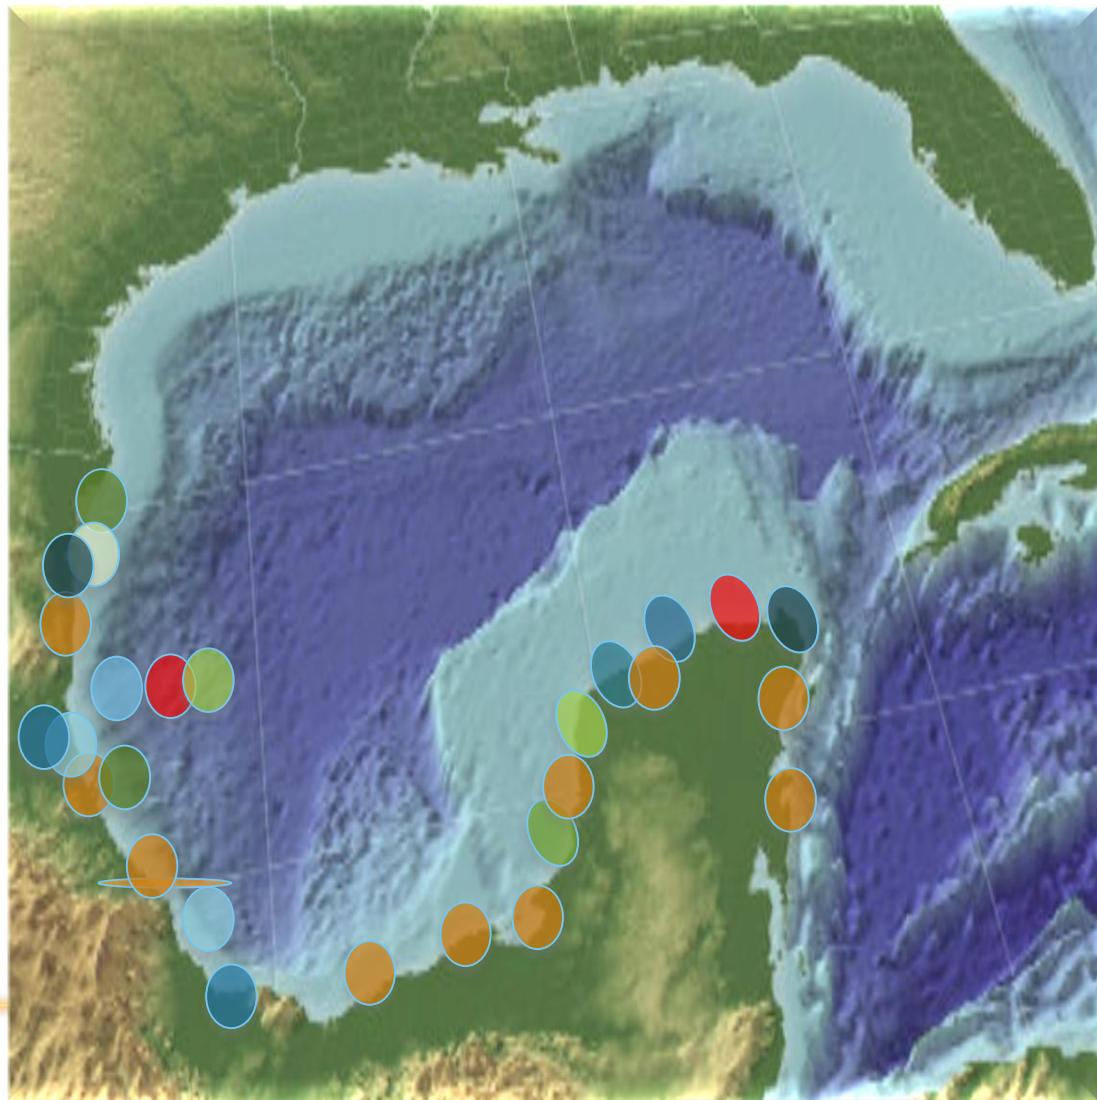

- Mean water level (sea level rise)
- Waves (tides, tsunami, wind)
- Currents (meso-scale, eddies, coastal, litoral)
- Atmospheric (wind, pressure, precipitation, heath & carbon fluxes)
- Sediment transport
- Flooding
- **Etc.**

2) Environmental:

- Hipoxia
- Pollution
- Water quality
- Habitat
- Hydrography (temperature, salinity, densitiy)
- **Etc.**

3) Socio-economics and Governance

- Human health
- **Etc.**

Workshop Provides Preliminary Scores

On 4-5 August 2016, a Report Card Workshop at the National Coastal Resilience Laboratory in Sisal assembled stakeholders and scientists interested in the sustainability of coastal resources in Yucatan, and to begin the process of creating a report card. The focus was on the coastal municipalities of the State of Yucatan, from el Cuyo to Celestun, and was further divided into four regions according to hydrogeological data. Participants first identified the key values or resources of and the greatest threats or drivers to the sustainable processes in the area. A series of indicators were then integrated into a 3-level qualitative score (good/ moderate/poor) for (i) Water Quality, (ii) Biodiversity, and (iii) Habitat. As a preliminary workshop exercise and based solely on their collective expert knowledge, qualitative scores were assigned to each region.

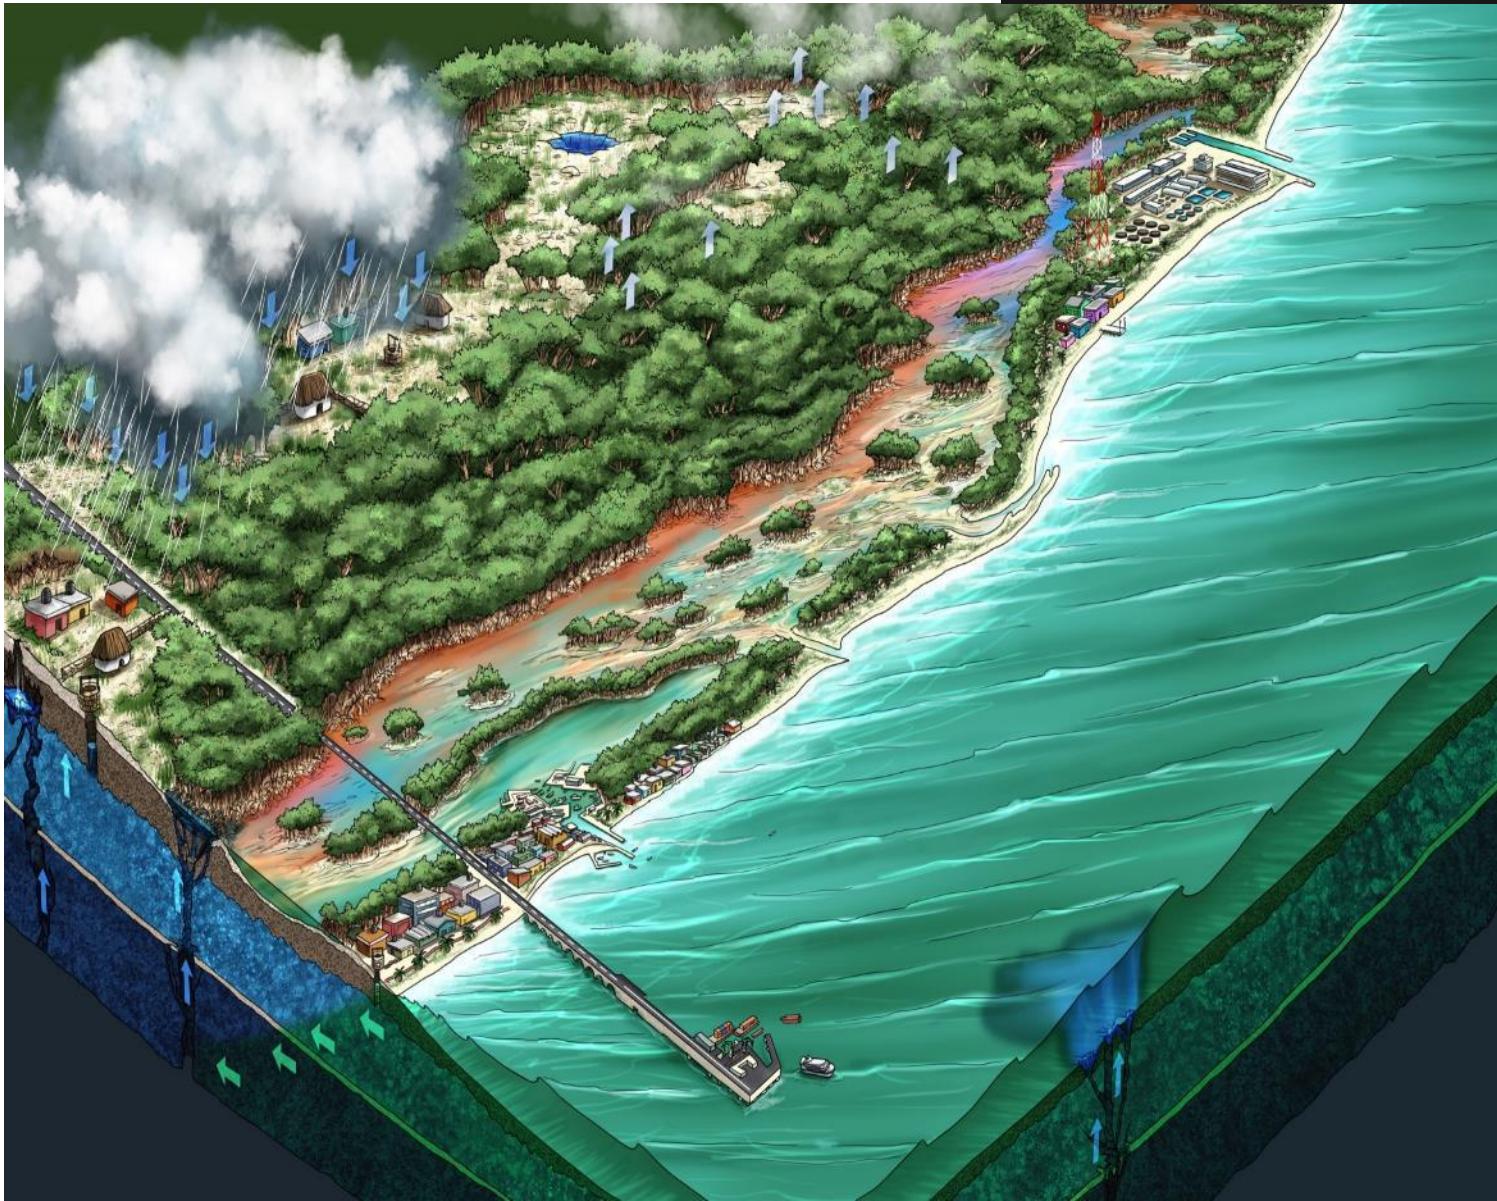

Based on the expert opinion of participants while at the Workshop, the objective of this qualitative assessment exercise, as shown on the map above, was to advance the discussion of creating a data-based report card.

By having an overview of the report card process and assigning qualitative assessment scores, the Workshop participants were able to envision the future quantitative report card, and recognize where challenges may lie ahead. These might include: to develop different or additional environmental indicators or thresholds as needed; seek input from additional stakeholders with specific areas of expertise; locate new sources for gaps in data.

Durante el mes de **mayo** se instalaran los primeros 3 sitios de HFR, en el estado de **Campeche** en colaboración con EPOMEX-UAC (Universidad Autónoma de Campeche) Durante los meses de **julio-agosto**, se instalaran dos sitios mas en el estado de **Tabasco** en colaboración con la UJAT (Universidad Juárez Autónoma de Tabasco).

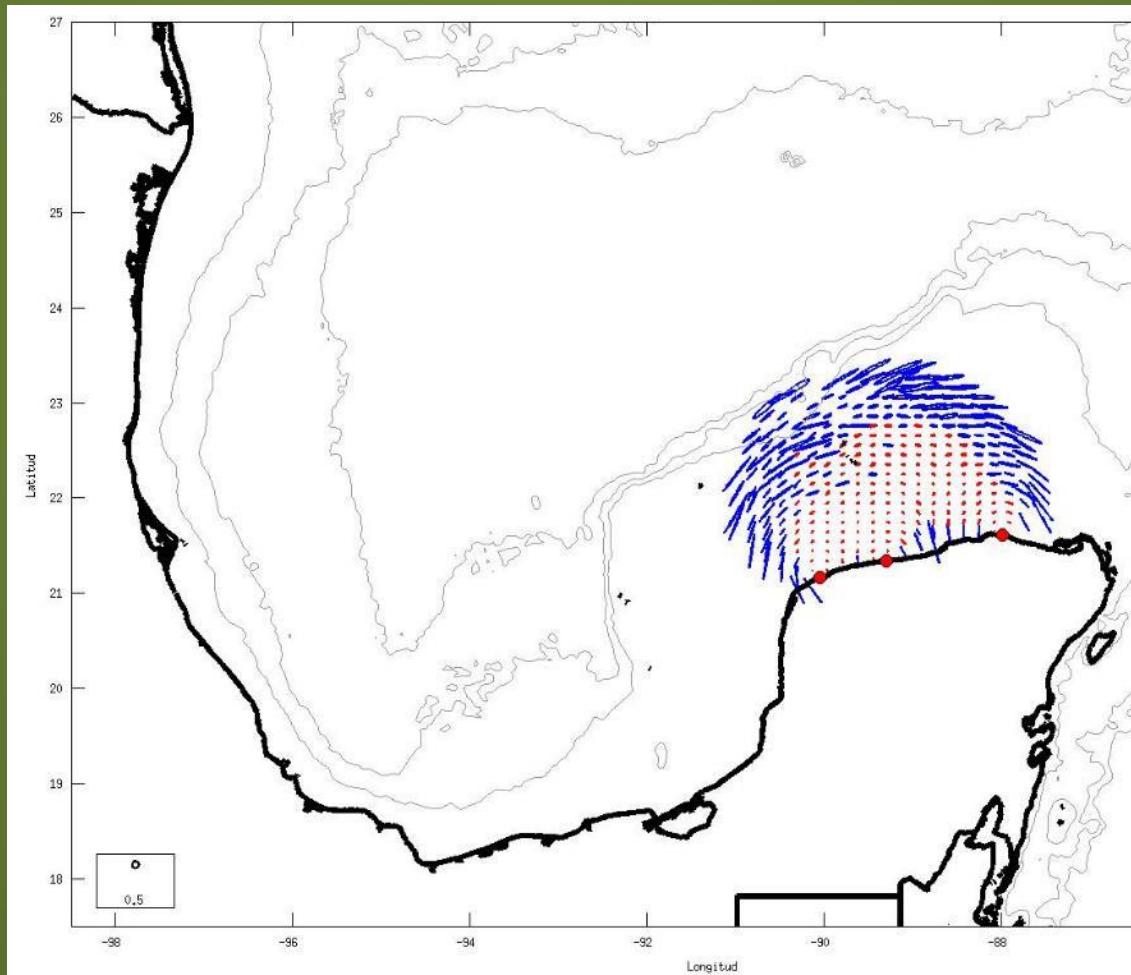

La figura muestra la cobertura esperada para las mediciones de corrientes.

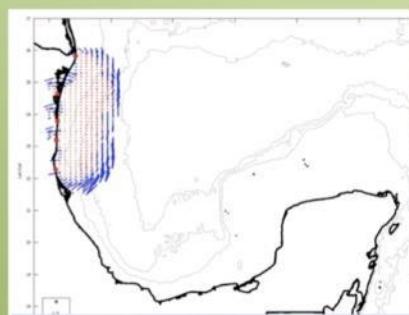

Durante los meses de **octubre-diciembre** se instalaran los HFR, del estado de **Veracruz** en colaboración con la UV (Universidad Veracruzana), así como también los sitios correspondientes al estado de **Tamaulipas** en colaboración con el CICATA-IPN

Durante inicios del 2018, se procederá con la instalación del estado de Yucatán en colaboración con el LIB-PC de la UNAM

Bluefin tuna larvae collaborative surveys

INSTITUTO
ESPAÑOL DE
OCEANOGRÁFIA

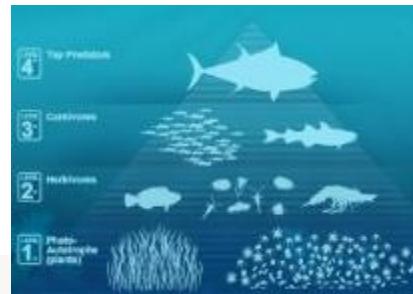

GLOBAL OBJETIVE

Characterize the Atlantic Bluefin Tunna larval trophodynamics and assess its influence on larval growth and predator-prey interactions with other top predator larvae, from a comparative ecosystem approach of their main spawning regions, the GOM and MED, which show contrasting environmental conditions.

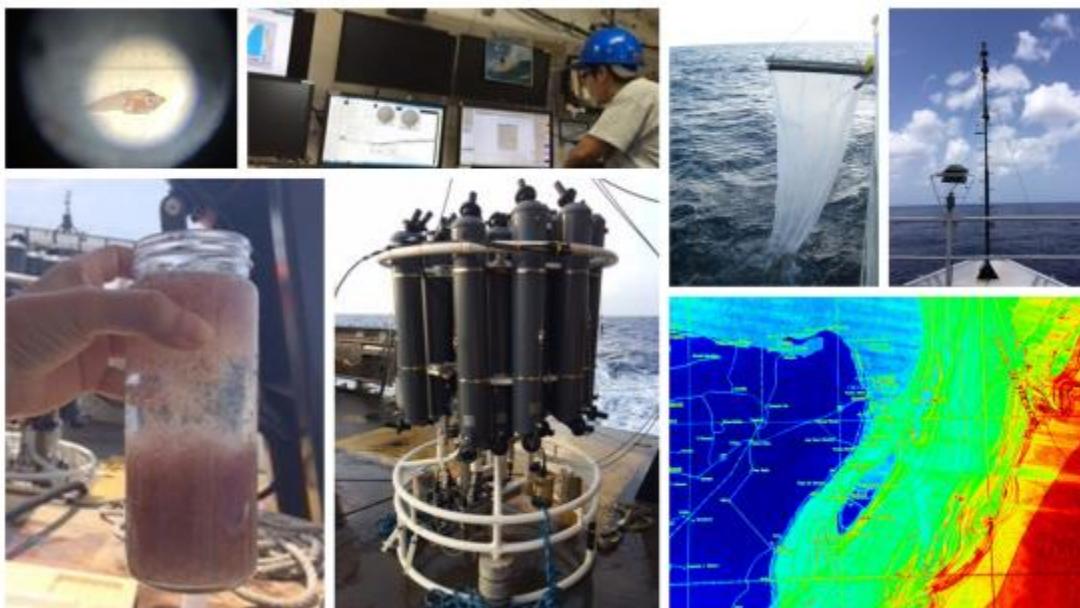

O4. Oceanographic features characterization. Comparative ABFT spawning ecosystem trophodynamics and related hydro-biological processes from the MED and the GOM regions.

The proposed objectives of this action include analyses of:

- 1) ABFT population genetic structure.
- 2) Bulk stable isotope analysis (SIA).
- 3) compound specific stable isotope of field-caught ABFT larvae (CSIA).
- 4) Otolith microstructure.
- 5) GH gene expression.
- 6) The environmental variables and the larval fish community will also be studied.

Recommendation for a RISK-based Approach to the management of Produced Water Discharges from Offshore Installations (RBA Recommendation) and associated Guidelines. The risk-based approach is a method of prioritising mitigation actions on those discharges and substances that pose the greatest risk to the environment.

Figure 1. Oil discharged in displacement and produced water (T)

What has been done so far?

OSPAR has adopted a wide range of programmes and measures to reduce pollution from all phases of offshore oil and gas activities. These include measures to reduce the amount of oil discharged in produced water (OSPAR Recommendation 2001/1) and measures to control the use and discharges of offshore chemicals (OSPAR Harmonised Mandatory Control System).
